

Site visit inspection report on compliance with HTA minimum standards

Uxbridge Mortuary

HTA licensing number 12435

Licensed under the Human Tissue Act 2004 for the

- making of a post mortem examination;
- removal from the body of a deceased person (otherwise than in the course of an anatomical examination or post-mortem examination) of relevant material of which the body consists or which it contains, for use for a scheduled purpose other than transplantation; and
- storage of the body of a deceased person or relevant material which has come from a human body for use for a scheduled purpose

01 July 2015

Summary of inspection findings

The HTA found the Designated Individual, the Licence Holder, the premises and the practices to be suitable in accordance with the requirements of the legislation.

Although the HTA found that Uxbridge Mortuary (the establishment) had met the majority of the HTA standards, one minor shortfall was found with regard to the Premises, Facilities and Equipment (PFE) standards.

Particular examples of strengths and good practice are included in the concluding comments section of the report.

The HTA's regulatory requirements

The HTA must assure itself that the Designated Individual, Licence Holder, premises and practices are suitable.

The statutory duties of the Designated Individual are set down in Section 18 of the Human Tissue Act 2004. They are to secure that:

- the other persons to whom the licence applies are suitable persons to participate in the carrying-on of the licensed activity;
- suitable practices are used in the course of carrying on that activity; and
- the conditions of the licence are complied with.

The HTA developed its licensing standards with input from its stakeholders. They are designed to ensure the safe and ethical use of human tissue and the dignified and respectful treatment of the deceased. The HTA inspects the establishments it licences against four groups of standards:

- consent
- governance and quality systems
- premises facilities and equipment
- disposal.

This is an exception-based report: only those standards that have been assessed as not met are included. Where the HTA determines that a standard is not met, the level of the shortfall is classified as 'Critical', 'Major' or 'Minor' (see Appendix 2: Classification of the level of shortfall). Where HTA standards are fully met, but the HTA has identified an area of practice that could be further improved, advice is given to the DI.

Reports of HTA inspections carried out from 1 November 2010 are published on the HTA's website.

Background to the establishment and description of inspection activities undertaken

Under the authority of the West London Coroner, the Uxbridge mortuary receives 750-800 bodies per year, of which 650-700 receive a post-mortem (PM) examination. These include high-risk and forensic cases. Paediatric cases are very infrequent and children under two years of age are referred to another HTA-licensed establishment.

The body store has 35 refrigerated spaces (including five spaces for bariatric cases) and five freezer spaces. With the recent addition of a temporary secure fridge unit outside the mortuary building, a further twenty five spaces have been added. This unit is only used for storage after a PM examination has taken place (see advice and guidance item 5).

Bodies are brought to the mortuary out of hours by undertakers nominated by the Coroner or, less frequently, by undertakers nominated by British Transport Police. The Mortuary Manager communicates with these undertakers regularly and sends relevant procedures via email.

The PM room has three downdraught PM tables, each with its accompanying downdraught dissection bench, with adequate working space and good lighting. The inspection team was informed that cases up to Hazard Group 3 are managed within the facility not including those with specific airborne risks, e.g. Tuberculosis. However, there was no supporting documentary evidence of appropriate ventilation within the PM room (see Inspection findings against standard PFE1, below).

There are three pathologists who attend the mortuary on a rota basis. In line with RCPath guidance, evisceration does not take place until the pathologist has conducted an external examination of the body. Tissue or samples that are retained during the PM examination are transferred to another HTA-licensed establishment for histological or toxicological

examination. The transfer of material is carried out by the pathologist or by courier and the establishment keeps a record of this transfer.

The mortuary has recently introduced a case coversheet that acts as an overall repository for information about each PM examination. It includes the unique mortuary reference number, name of the deceased, date of death, date of PM examination and information concerning tissue retention and transfer. The receipt of tissue forms noting the family's wishes post coronial authority and undertaker's release forms are also noted on the coversheet, and the forms themselves attached. The active case coversheets and associated forms are stored in a number of box files that are labelled to indicate the status of each case.

The deceased are only released to undertakers upon receipt of a coroner's release note. This is either brought by the undertaker or emailed directly to the mortuary. When the release note is emailed a contact number for the nominated undertaker or the deceased's family is included. The Mortuary Manager uses this to establish which undertaker to expect for collection of the body (see advice and guidance item 3).

The mortuary is currently staffed by one full time Anatomical Pathology Technologist (the Mortuary Manager) and one part time trainee APT. Locum staff are used occasionally and the establishment tries to ensure that locums familiar with the facility attend. Locums are always supervised (see advice and guidance item 1).

This report describes the third routine inspection of Uxbridge Mortuary. The inspection encompassed a visual inspection of the mortuary, including the body storage area and PM suite, a document review and interviews with staff.

Traceability audits were also completed during the inspection. The first consisted of a simple body storage audit, whereby three names were selected from the whiteboard and the details on the wrist and foot identification tags were checked against those in the register. The second audit followed an item of retained tissue; the case coversheet, tissue retention forms and autopsy register were checked. No anomalies were found.

Inspection findings

The HTA found the Designated Individual and the Licence Holder to be suitable in accordance with the requirements of the legislation.

Compliance with HTA standards

Standard	Inspection findings	Level of shortfall
PFE1 The premises are fit for purpose.	The recommended minimum number of air changes in a PM room is ten per hour for the management of cases up to Hazard Group 3.	Minor
	The inspection team saw no evidence that air changes are being measured and was not able to establish whether the minimum number of changes is occurring.	

Premises, Facilities and Equipment

Advice

The HTA advises the DI to consider the following to further improve practices:

No.	Standard	Advice
1.	GQ1	The DI is advised to implement a system to record that staff have read and understood the establishment's policies and procedures. An extra member of staff is to be recruited in the near future; this and the use of locums makes it important that steps are taken to ensure they are familiar with and working to approved procedures.
2.	GQ2	The DI is advised to review the scope of audits that are scheduled by the establishment and include compliance of staff with documented procedures.
3.	GQ6	The DI is advised to formalise the procedure to release a body where the attending undertaker does not arrive with any paperwork and the release note has been emailed separately to the mortuary. In this case a second identifier such as an address should be requested from the undertaker to confirm the identity of the deceased.
4.	PFE3	The DI is advised to document the acceptable temperature ranges and alarm trigger points for fridges and freezers. These temperatures should be readily available to the staff monitoring temperatures.
5.	PFE3	The DI is advised to place a notice in a prominent position setting out what actions should be taken if the temporary external fridge alarm is heard. This alarm is not linked to the call out system and mortuary staff do not regularly attend the mortuary out of hours or at the weekend. However, there is frequent attendance out of hours by the nominated undertakers and they should have instructions on how to respond should the alarm be ringing when they attend.

Concluding comments

Uxbridge is a busy mortuary staffed by two individuals. The DI has been active in establishing a number of systems to improve governance. The Quality manual is well developed and includes good use of flow diagrams, for example on the receipt/release of a body. The case coversheet system is clear and allows the status of any cases to be established quickly. The procedure for finding out the identity of the appointed undertaker via the family of the deceased is clear and contains a suggested telephone script to help maintain a consistent and sensitive approach to the bereaved. The overall approach to handling the deceased is sensitive and caring.

There are areas of practice that require improvement, including one minor shortfall. In addition, the HTA has given advice to the Designated Individual on a range of issues, including SOPs, audits and temperature monitoring.

The HTA requires that the DI addresses the shortfall by submitting a completed corrective and preventative action (CAPA) plan within 14 days of receipt of the final report (refer to Appendix 2 for recommended timeframes within which to complete actions). The HTA will then inform the establishment of the evidence required to demonstrate that the actions agreed in the plan have been completed.

The HTA has assessed the establishment as suitable to be licensed for the activities specified subject to corrective and preventative actions being implemented to meet the shortfall identified during the inspection.

Report sent to DI for factual accuracy: 29 July 2015

Report returned from DI: 26 August 2015

Final report issued: 03 September 2015

Completion of corrective and preventative actions (CAPA) plan

Based on information provided, the HTA is satisfied that the establishment has completed the agreed actions in the CAPA plan and in doing so has taken sufficient action to correct all shortfalls addressed in the Inspection Report.

Date: 23 November 2018

Appendix 1: HTA standards

The HTA standards applicable to this establishment are shown below; those not assessed during the inspection are shown in grey text. Individual standards which are not applicable to this establishment have been excluded.

Consent standards				
C1 Consent is obtained in accordance with the requirements of the Human Tissue Act 2004 (HT Act) and as set out in the code of practice				
•	There is a documented policy which governs consent for post-mortem examination and the retention of tissue and reflects the requirements of the HT Act and the latest version of the HTA Code of Practice on consent.			
•	There is a documented SOP detailing the consent process (including who is able to take consent, what training they must receive, and what information must be provided to those giving consent for post-mortem examination).			
•	There is written information about the consent process (provided to those giving consent), which reflects the requirements of the HT Act and the latest version of the HTA Code of Practice on consent.			
C2 Information about the consent process is provided and in a variety of formats				
•	Relatives are given an opportunity to ask questions.			
•	Relatives are given an opportunity to change their minds and is it made clear who should be contacted in this event.			
•	Information contains clear guidance on options for how tissue may be handled after the post-mortem examination (repatriated with the body, returned to the family for burial/cremation, disposed of or stored for future use).			
•	Where consent is sought for tissue to be retained for future use, information is provided about the potential uses in order to ensure that informed consent is obtained.			
•	Information on the consent process is available in different languages and formats, or there is access to interpreters/translators.			
	Iff involved in seeking consent receive training and support in the implications and tial requirements of taking consent			
•	There is a training programme for taking consent for post-mortem examination and tissue retention which addresses the requirements of the HT Act and HTA code of practice on consent.			
•	Refresher training is available (e.g. annually).			
•	Attendance at consent training is documented.			
•	If untrained staff are involved in consent taking, they are always accompanied by a trained individual.			

Governance and quality system standards

GQ1 All aspects of the establishments work are supported by ratified documented policies and procedures as part of the overall governance process

- Documented policies and SOPs cover all mortuary/laboratory procedures relevant to the licensed activity. These may include:
 - post-mortem examination, including the responsibilities of the APTs and Pathologists (e.g. evisceration) and management of high risk cases
 - o record keeping
 - o receipt and release of bodies, which reflect out of hours arrangements
 - o lone working in the mortuary
 - transfer of bodies and tissue (including blocks and slides) to other establishments or off site
 - o ensuring that tissue is handled in line with documented wishes of the relatives
 - disposal of tissue (including blocks and slides)

(Note that individual SOPs for each activity are not required. Some SOPs will cover more than one activity.)

- Policies and procedures are regularly reviewed (for example, every 1-3 years).
- There is a system for recording that staff have read and understood the latest versions of these documents.
- Deviations from documented SOPs are recorded and monitored.

GQ2 There is a documented system of quality management and audit

- There is a quality manual which includes mortuary activities.
- Policies and SOPs are version controlled (and only the latest versions available for use).
- There is a schedule for audits to be carried out (which may include vertical and/or horizontal audits).
- Audits include compliance with documented procedures, records (for completeness) and traceability.
- Audit findings document who is responsible for follow up actions and the timeframe for completing those actions.
- Regular audits of tissue being stored at the establishment ensure that staff are fully aware what material is held and why.
- There is a complaints system in place.

GQ3 Staff are appropriately qualified and trained in techniques relevant to their work and are continuously updating their skills

- Staff are appropriately trained/qualified or supervised.
- Staff have annual appraisals.
- Staff are given opportunities to attend training courses, either internally or externally.
- Attendance by staff at training events is recorded.

• There is a documented training programme for new mortuary staff (e.g. competency checklist).

GQ4 There is a systematic and planned approach to the management of records

- There is a system for managing records which includes which records must be maintained, how they are backed up, where records are kept, how long each type of record is retained and who has access to each type of record.
- There are documented SOPs for record management.

GQ5 There are documented procedures for donor selection and exclusion, including donor criteria.

GQ6 A coding and records system facilitates traceability of bodies, body parts, tissues and cells, ensuring a robust audit trail

- Bodies are tagged/labelled upon arrival at the mortuary.
- There is a system to track each body from admission to the mortuary to release for burial or cremation (e.g. mortuary register, patient file, transport records).
- Organs and tissue samples taken during PM examination are fully traceable.
- Details of organs retained and the number of wax blocks and tissue slides made are recorded.
- The traceability system includes the movement of tissue samples between establishments.
- Details are recorded of tissue that is repatriated or released with the body for burial or cremation.
- Regular audits of tissue storage and traceability are undertaken to ensure compliance with operational procedures; tissue samples found which are not being stored with consent are disposed of with reference to the family's wishes.
- Multiple identifiers used, including at least one unique identifier (e.g. post mortem number, name, dates of birth/death, etc) to identify bodies and tissue.

GQ7 There are systems to ensure that all adverse events, reactions and / or incidents are investigated promptly

- Staff are trained in how to use the incident reporting system.
- Staff know how to identify incidents and near-misses which must be reported, including those that must be reported to the HTA
- The incident reporting system clearly outline responsibilities for reporting, investigating and follow up for incidents.
- The incident reporting system ensures that follow up actions are identified (i.e. corrective and preventative actions) and completed.
- Information about incidents is shared with all staff (including the reporter) to avoid repeat errors.

GQ8 Risk assessments of the establishment's practices and processes are completed regularly and are recorded and monitored appropriately

- All procedures related to the licensed activities (as outlined in standard GQ1) are risk assessed.
- Risk assessments include risks associated with non-compliance with HTA standards as well as health and safety risks.
- Risk assessments are reviewed regularly (along with SOPs), for example every 1-3 years.
- Risk assessments include how to mitigate the identified risks; this includes actions that need to be taken, who is responsible for each action, deadlines for completing actions and confirmation that actions have been completed.

Premises, facilities and equipment standards

PFE1 The premises are fit for purpose

- There is sufficient space for the activities to be carried out.
- Refrigerated storage units are in good working condition and well maintained.
- Surfaces are made of non-porous materials.
- The premises are in reasonable condition (structure and cleanliness of floors, walls, entranceways).
- The premises are secure (e.g. there is controlled access to bodies, tissue, equipment and records).

PFE 2 Environmental controls are in place to avoid potential contamination

- There is clear separation of clean, transitional and dirty zones (e.g. doors, floor markings, signs).
- There is appropriate PPE available and routinely worn by staff.
- There is adequate critical equipment and/or PPE available for high risk post mortems.
- There are documented cleaning and decontamination procedures.
- There are documented cleaning schedule and records of cleaning and decontamination.

PFE3 There are appropriate facilities for the storage of bodies, body parts, tissues and cells, consumables and records.

- There is sufficient capacity for storage of bodies, organs and tissues.
- Temperatures of fridges and freezers are monitored on a regular basis.
- There are documented contingency plans in place should there be a power failure, or overflow.
- Bodies are shrouded whilst in storage.
- There is separate storage for infants and babies. If not, special measures are taken for the bodies of infants and babies.

PFE 4 Systems are in place to protect the quality and integrity of bodies, body parts, tissues and cells during transport and delivery to a destination

- There are documented procedures for transportation of bodies and tissue anywhere outside the mortuary (e.g. lab, other establishment), including record-keeping requirements.
- There are written agreements in place with any external parties (e.g. undertaker, or courier) who transport bodies and/or tissue behalf of the establishment (laboratory or mortuary).

(Note that coroners usually have their own agreements with external parties for transportation bodies and tissue; however, documentation for traceability purposes must still be maintained by the establishment for these cases.)

PFE5 Equipment is appropriate for use, maintained, quality assured, validated and where appropriate monitored

- Items of equipment in the mortuary are in a good condition and appropriate for use:
 - o fridges / Freezers
 - o hydraulic trolleys
 - post mortem tables
 - o hoists
 - saws (manual and/or oscillating)
 - PPE for high risk cases (e.g. respirators)
- The use of porous materials is kept to a minimum and has been risk assessed
- Maintenance/service records are kept for equipment, including fridges/freezers, trolleys, post mortem tables (if downdraught) and post mortem suite ventilation.

(Note: These records may be held by the mortuary or centrally by the Trust, e.g. Estates Department.)

Disposal Standards

D1 There is a clear and sensitive policy for disposing of human organs and tissue

- There is a documented Trust or mortuary/laboratory policy for the disposal of human tissue, which reflects the requirements of the HTA code of practice on disposal.
- The policy states the position with regard to the retention and use of microscope slides, and in particular that tissue slides must be disposed of or returned to the family in accordance with their wishes if consent is not obtained for their continued storage and future use once the PM has concluded.

D2 PM tissue is disposed of if consent is not given for its storage and use for scheduled purposes

- There are documented procedures for disposal of human tissue, which include methods of disposal for whole organs, wet tissue, wax blocks and microscope slides.
- Tissue is disposed of in accordance with the documented wishes of the deceased person's

family.

- Disposal details of organs and tissue blocks are recorded, including the date and method of disposal.
- There is a rolling programme of tissue disposal that ensures that tissue, including microscope slides, is disposed of in a timely fashion when it is no longer needed for the purposes of the Coroner or to determine the cause of death.

Appendix 2: Classification of the level of shortfall

Where the HTA determines that a licensing standard is not met, the improvements required will be stated and the level of the shortfall will be classified as 'Critical', 'Major' or 'Minor'. Where the HTA is not presented with evidence that an establishment meets the requirements of an expected standard, it works on the premise that a lack of evidence indicates a shortfall.

The action an establishment will be required to make following the identification of a shortfall is based on the HTA's assessment of risk of harm and/or a breach of the HT Act or associated Directions.

1. Critical shortfall:

A shortfall which poses a significant risk to human safety and/or dignity or is a breach of the Human Tissue Act 2004 (HT Act) or associated Directions

or

A combination of several major shortfalls, none of which is critical on its own, but which together could constitute a critical shortfall and should be explained and reported as such.

A critical shortfall may result in one or more of the following:

- (1) A notice of proposal being issued to revoke the licence
- (2) Some or all of the licensable activity at the establishment ceasing with immediate effect until a corrective action plan is developed, agreed by the HTA and implemented.
- (3) A notice of suspension of licensable activities
- (4) Additional conditions being proposed
- (5) Directions being issued requiring specific action to be taken straightaway

2. Major shortfall:

A non-critical shortfall that:

- poses a risk to human safety and/or dignity, or
- indicates a failure to carry out satisfactory procedures, or
- indicates a breach of the relevant CoPs, the HT Act and other relevant professional and statutory guidelines, or
- has the potential to become a critical shortfall unless addressed

or

A combination of several minor shortfalls, none of which is major on its own, but which, together, could constitute a major shortfall and should be explained and reported as such.

In response to a major shortfall, an establishment is expected to implement corrective and preventative actions within 1-2 months of the issue of the final inspection report. Major shortfalls pose a higher level of risk and therefore a shorter deadline is given, compared to minor shortfalls, to ensure the level of risk is reduced in an appropriate timeframe.

3. Minor shortfall:

A shortfall which cannot be classified as either critical or major, but which indicates a departure from expected standards.

This category of shortfall requires the development of a corrective action plan, the results of which will usually be assessed by the HTA either by desk based or site visit.

In response to a minor shortfall, an establishment is expected to implement corrective and preventative actions within 3-4 months of the issue of the final inspection report.

Follow up actions

A template corrective and preventative action plan will be sent as a separate Word document with both the draft and final inspection report. You must complete this template and return it to the HTA within 14 days of the issue of the final report.

Based on the level of the shortfall, the HTA will consider the most suitable type of follow-up of the completion of the corrective and preventative action plan. This may include a combination of

- a follow-up site-visit inspection
- a request for information that shows completion of actions
- monitoring of the action plan completion
- follow up at next desk-based or site-visit inspection.

After an assessment of your proposed action plan you will be notified of the follow-up approach the HTA will take.
